
Dynamic update - wrong characters [SOLVED]

Posted by haster - 2007/01/02 05:08

The module 2.2 is cool :).Thanks for it.

When I set (in administration panel) Dynamic update - up to 0, after refresh on my main page(<http://oks.com.pl>) Iâ€™m getting wrong characters code for my language.
I have not any idea. Please help.

When you set it to 0 - bad characters?
When you set it to 60 - everything is all right?

Re:Dynamic update - wrong characters

When I set it to 0 - everything is OK?
When I set it to 10,20,... - got bad characters?

Re:Dynamic update - wrong characters

yes I can see the problem.

Problem is in different processing in static and dynamic. Static prints out directly by your server php code and client browser only presents it. Dynamic, server responds to http requests and javascript of client browser prints it out. I'll try to figure out a fix for it.

Please, send email to support@blastchat.com with this problem description, so I can send you updated files for testing purposes.

Is dynamic working with AJAX?

Re:Dynamic update - wrong characters

Posted by Prutkar - 2007/01/09 12:27

no, it is not AJAX, may be only setting the header with charset definition is missing. If I find time I'll do it in full AJAX.

Have you fix the problem?
I have the same problem, please help me!!

Re:Dynamic update - wrong characters

Not yet, I probably will have to release whole new client and module to fix this in some elegant way.

I think the difference is between encodings used on your site, i.e. difference between what MySQL us using, what PHP is using and what your html output is.

1st printout of names is done directly by PHP generated page, every dynamic update is generated by PHP but printed out by javascript and that's where the problems seems to come in.

May be it would be enough to adjust some headers in AJAX return, hm. I have tried different things but so far no simple solution worked, new module will be completely changed and hopefully that will solve it.

Till then, if you are developer who can debug and test, please, go on and fiddle with module and client, if you are able to fix the problem I think more webadmins would be happy about it.

If any of you who has this problem could try to do the following:

Edit ../components/com_blastchatc/dynamic.blastchatc.php file, find function getContent, add following line after global variables definitions (put it somewhere like 3rd line):

```
header( "Content-Type: text/html; charset=UTF-8" );
```

(you can change UTF-8 to charset of your site if it does not work)

This is just an idea which I can not test as I do not have website with different charset then UTF-8.

It will be highly appreciated if you report back to this topic the result of test.

Woow, perfect!!

Now it's all right!!

Please, I have unfelled in blascht and the module fails, as they explain it in the most top note, here it is said that adding header (" Content-Type: text/html; charset=UTF-8 "); it works, but not exactly in that part(report) of the code adds happiness IÃ-nea of code, Graces(Thanks) His(Its) friend Eduardo Oozco Najera from Durango
Example: function getContent(\$bc_params) {

```
global $mosConfig_absolute_path, $mosConfig_live_site, $mosConfig_lifetime, $database, $mosConfig_lang, $Itemid;
```

```
if (!file_exists($mosConfig_absolute_path.'/components/com_blastchatc/module.blastchatc.php')) {  
    echo "Missing file ".$mosConfig_absolute_path."/components/com_blastchatc/module.blastchatc.php";  
    return;  
}
```

In that it(he,she) divides her(it) I add?

Hi,

For accentuated chars, the code is iso-8859-1

```
header (" Content-Type: text/html; charset=iso-8859-1 "Ã«Ã»);
```
